

Battery Connector for Nova Refrigerator/Freezer

The refrigerator has a connector where both halves are identical. This means there is no separate male and female connector.

1. First, attach the terminals (the small silver contacts) to the wires using a crimping tool. It is recommended to use a heavy-duty crimping tool to ensure a secure and proper crimp.
2. Once the terminals have been attached to the wires, push them into the connector housing. You should hear a distinct "click" when the terminal is correctly installed.
3. Make sure that the positive (+) and negative (-) wires are positioned correctly in the connector housing. This is important because the connector plugs into the connector already installed on the refrigerator, and incorrect positioning may result in reversed polarity.
